### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**DETAILED ACTION**

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by Matsuda et al. (U.S. Patent No. 5,834,762).

Regarding claim 1, Matsuda et al. discloses an image reading apparatus which includes an image reading sensor for reading an image of an original document and converting the image into an electrical signal, which adjusts an optical axis of light irradiated and reflected by the original document to project the light on the image reading sensor and reads the image of the original document by the image reading sensor to convert the image into the electrical signal (col. 3, line 29 through col. 4, line 17), wherein

the image reading apparatus further comprises an output value detecting mechanism which detects an output value of the image reading sensor which is varied in accordance with a deviation in the optical axis (col. 5, lines 25-55).

Regarding claim 2, Matsuda et al. discloses the image reading apparatus according to claim 1, wherein the image reading sensor comprises a CCD sensor (col. 4, line 1).

Regarding claim 3, Matsuda et al. discloses an image reading apparatus which includes an image reading sensor for reading an image of an original document and converting the image into an electrical signal, which adjusts an optical axis of light irradiated and reflected by the

Art Unit: 2622

original document to project the light on the image reading sensor and reads the image of the original document by the image reading sensor to convert the image into the electrical signal (col. 3, line 29 through col. 4 line 17), wherein the image reading apparatus further comprises an output value detecting mechanism which detects an output value of the image reading sensor which is varied in accordance with a deviation in the optical axis, and an optical axis adjusting mechanism which adjusts the optical axis such that the output value detected by the output value detecting mechanism becomes an appropriate value (col. 5, lines 25-55).

Regarding claim 4, Matsuda et al. discloses the image reading apparatus according to claim 3, wherein the image reading sensor comprises a CCD sensor (col. 4, line 1).

#### ***Allowable Subject Matter***

Claims 5 and 6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
